

## **ECP5-5G™ Versa Development Board User Guide**

---

EB103 Version 1.2, January 2016

## Introduction

The ECP5-5G™ Versa Development Board allows designers to investigate and experiment with the features of the ECP5-5G Field-Programmable Gate Array. The features of the ECP5-5G Versa Development Board can assist engineers with rapid prototyping and testing of their specific designs. The ECP5-5G Versa Development Board is part of the ECP5-5G Versa Development Kit. The guide is intended to be referenced in conjunction with demo user guides to demonstrate the ECP5-5G FPGA.

**Figure 1. ECP5-5G Versa Development Board, Top Side**

## Features

- Half-length PCI Express form-factor
  - Allows demonstration of PCI Express x1 interconnection
- Electrical testing of one full-duplex SERDES channel via SMA connections
- USB-B connection for UART and device programming
- Two RJ45 interfaces to 10/100/1000 Ethernet to RGMII
- On-board Boot Flash
  - 128M Serial SPI Flash
- DDR3-1866 memory components (64Mb/x16)
- Expansion mezzanine interconnection for prototyping
- 14-segment alpha-numeric display
- Switches, LEDs and displays for demo purposes
- Diamond® programming support
- On-board reference clock sources

The contents of this user guide include top-level functional descriptions of the various portions of the evaluation board, descriptions of the on-board connectors, diodes and switches and a complete set of schematics.

*Caution: The ECP5-5G Versa Development Board contains ESD-sensitive components. ESD safe practices should be followed while handling and using the evaluation board.*

## **ECP5-5G Device**

This board features an ECP5-5G FPGA with a 1.2 V core supply. It can accommodate all pin-compatible ECP5-5G devices in the 381 ball cabGPA package. A complete description of this device can be found in DS1057, [ECP5-5G Family Data Sheet](#).

*Note: The connections referenced in this document refer to the **LFE5UM5G-45F-8BG381C** device.*

## **Applying Power to the Board**

The ECP5-5G Versa Development Board is ready to power on. The board can be supplied with power from a PCI Express host system or standalone with an external wall power module.

The 12 V DC input power source is fused with a surface mounted fuse, as noted in Table 1.

**Table 1. Board Power Supply Fuses** (See Appendix A, Sheet 2, Figure 14- Voltage Regulators)

Fuse Designator	Description
F1	12 V Input Supply Fuse

The board may be plugged into a host PC. Only plug the board into a PCI Express slot when the system is powered off. Once inserted, the PC can be safely powered on.

Using the evaluation board outside of a PC chassis supply requires the factory-supplied wall supply module. Use of other supplies is not suggested.

**Figure 2. Power Distribution Scheme** (See Appendix A, Sheet 2, Figure 14- Voltage Regulators)

## Programming/FPGA Configuration

The ECP5-5G Versa Development Board has a built-in download controller for programming the ECP5-5G FPGA. The built-in module consists of a USB Type-B connector and a USB UART device. To use the built-in download cable, simply connect a standard USB cable (a USB-B to USB-A cable is included with the ECP5-5G Versa Development Kit) from J2 to your PC (with Diamond programming software installed). The USB hub on the PC will detect the addition of the USB function, making the built-in cable available for use with the Diamond programming software. The USB cable is connected in parallel to J3.

### Alternate Programmer Download Interface

J3 is a 10 pin JTAG connector that is provided for use with an external Lattice download cable (available separately). A USB download cable can be attached to the board using J3 to interface with the FPGA (U1).

*Note: Resistors R38, R33, R32 and R36 need to be removed for programming with J3.*

The same interface can be used to access the ispClock 5406D clock device (U13) by reconfiguring the jumpers on J50 (See Appendix A, Sheet 3, Figure 15 - Programming). U13 is factory-programmed for use with the reference designs and should only be altered for customized designs.

**Table 2. JTAG Connector Pinout (J3)** (See Appendix A, Sheet 3, Figure 15 - Programming)

Pin	Function
1	PWR
2	TDO
3	TDI
4	PROGRAMn
5	N/C
6	TMS
7	GND
8	TCK
9	DONE
10	INITn

## Diamond Programmer Requirements

*Note: This board includes the built-in download module and only requires the USB cable included with the board. After initial board setup, use the following procedure to program the board. Instructions assume that Diamond Programmer software has been installed on a local PC.*

Requirements:

- PC with Diamond Programmer 3.5.1 (or later) programming software, installed with appropriate drivers (USB driver for USB cable).

*Note: An option to install these drivers is included as part of the Diamond Programmer setup.*

## Setting the Configuration Mode

The ECP5-5G device on the ECP5-5G Versa Development Board supports a variety of configuration modes, including 1149.1 JTAG and Master SPI. Refer to TN1260, [ECP5 and ECP5-5G sysCONFIG Usage Guide](#). On the PCB, use the CFG Setting Dip Switch SW4 described in Table 3.

*Note: SW4.4 is unused.*

**Figure 3. SW4**

**Table 3. CFG[2:0] Selection**

Configuration Mode	CFG[2:0]	SW4.3	SW4.2	SW4.1
1149.1 JTAG only	000	Down	Down	Down
Slave SPI	001	Down	Down	Up
Master SPI	010	Down	Up	Down
SCM (Slave_Serial)	101	Up	Down	Up
SCM (Slave_Parallel)	111	Up	Up	Up

## Board Programming

The ECP5-5G programmable devices can be programmed using a computer running Lattice Diamond or Lattice Diamond Programmer software connected to the Development board via a standard mini-USB cable. Refer to the ECP5-5G Versa Development Kit Quick Start Guide (QS039) for more details. Once the programming software is installed and the USB cable is connected to the board, the programmable devices can be programmed.

**Figure 4. J50**

The ECP5-5G FPGA (U1) and the ispClock5406D (U13) device can be programmed individually or together. JTAG Chain Selector Header J50 is used to select which device(s) will be connected to the JTAG programming bus. The ECP5-5G FPGA SRAM can be programmed directly, or the subtended configuration serial SPI flash (U52) programmed, via the same J50 setting. See Table 4 and the diagrams below.

**Table 4. JTAG Chain Selector**

J50 Shunts	JTAG Chain
1-2, 3-4, 5-6	ECP5-5G + ispClock
1-2, 3-5	ECP5-5G only
2-4, 5-6	ispClock only

**Figure 5. J50 Settings**

**Figure 6. ECP5-5G Status LEDs and Push-button Controls**

The LEDs indicate the configuration status of the ECP5-5G FPGA.

- **D17 (red)** illuminated indicates that programming was aborted or reinitialized, driving the INITN output low.
- **D20 (green)** illuminated indicates the successful completion of configuration by releasing the open collector DONE output pin.
- **D19 (red)** illuminated indicates that PROGRAMN is low.
- **D18 (red)** illuminated indicates that GSRN is low.

## PROGRAMN and GSRN

These push-button switches assert/de-assert the logic levels on PROGRAMN (SW2) and GSRN (SW1). Depressing the button drives a logic level “0” to the device.

## Programming Serial SPI Flash Memory

A serial SPI (16-pin TSSOP, 128M) Flash memory device (U52) is on-board for non-volatile configuration memory storage. A Micron N25Q128A device is populated on-board.

The Serial SPI Flash memory device can be configured easily via the ECP5-5G JTAG port. This mode enables the FPGA to be programmed at power-up or assertion of PROGRAMN with a bitstream stored in the memory device.

1. Connect the ECP5-5G Versa Development Board.
2. Set J50 jumper to *ECP5-5G only* programming (See the [Board Programming](#) section.)
3. Scan the board or select the **LFE5UM5G-45F** device in the ECP5UM5G device family.
4. From the Edit pull down menu select **Device Properties**. Set the Access mode to **SPI Flash Background Programming** and Operation to **SPI Flash Erase, Program, Verify**.

**Figure 7. Diamond Programmer Main Screen**

5. Under the SPI Flash Options, select Family to **SPI Serial Flash**, Vendor to **Micron**, Device to **SPI-N25Q128A**, Package to **16-pin SO16**.

**Figure 8. Device Properties Dialog Box**

6. Click **OK** in the Device Properties dialog box. You will return to the main configuration screen.
7. From the main programming window, select **Program** from the top toolbar. This begins the SPI Serial Flash programming. Note that the SPI Flash Background Programming operation is only possible when the ECP5-5G device is either erased or the active design has the **MASTER\_SPI\_PORT** mode enabled. For more details see TN1260, [ECP5 and ECP5-5G sysCONFIG Usage Guide](#).

## On-Board Clock Capabilities

(See Appendix A, Sheet 9, Figure 21 - Reference Clock Generator)

The ECP5-5G Versa Development Board allows for several clock source options. Some of these options are controlled via the ispClock5406D programmable clock manager device. The ispClock5406D enables the reference clock from the PCI Express interface to provide a reference clock to the SERDES. This is true only when the board is in a PCI Express host socket. When the board is not in a PCI Express host socket, the clock will be supplied by a 156.25 MHz clock on-board oscillator. Both clock inputs can be fanned out to the dedicated SERDES reference inputs, FPGA inputs, and to the expansion connectors. The factory default programming provides a variety of clocks to the SERDES and FPGA inputs to support Factory defined 5G applications. The ispClock chip may be programmed with user defined configurations to support a wide range of user applications.

**Figure 9. Clock Controller Scheme**

## General Purpose Clock Source

An on-board 100 MHz LVDS oscillator is provided for general purpose use. This clock source is connected to differential inputs P3 and P4 and must be used as LVDS inputs to the FPGA. This pin pair also provides optimal interface to the FPGA PLL for customized use.

The PCI Express add-in card specification requires add-in boards to include capabilities to tell the host of its presence. The ECP5-5G Versa Development Board allows this optional connection via a board jumper. Using the board with a PCI Express host requires the setting shown in Figure 10 below.

**Figure 10. PCI Express PRSNT Control Connection**

## SERDES

The ECP5-5G Dual Channel Unit (DCU) SERDES FPGA is utilized on the board for several purposes. DCU0, Channel 0 is provisioned to provide a single, full-duplex PCI Express channel. The high-speed signals are connected to the PCI Express edge connection. DCU0, Channel 1 is connected to the SMA connectors for external electrical demonstrations.

**Table 5. PCI Express Channel Interconnections**

Signal Name	SERDES Port	FPGA Ball Number
PETp0	HDRXP0_D0CH0	Y5
PETn0	HDRXN0_D0CH0	Y6
PERp0	HDTXP0_D0CH0	W4
PERn0	HDTXN0_D0CH0	W5

**Table 6. SMA Test Interconnections**

Connector	SERDES Port	FPGA Ball Number
J5	HDRXP0_D0CH1	Y7
J6	HDRXN0_D0CH1	Y8
J7	HDTXP0_D0CH1	W8
J8	HDTXN0_D0CH1	W9

## FPGA Test Pins

(See Appendix A, Sheet 8, Figure 20 - LEDs and Switches)

### General Purpose DIP Switches

General purpose FPGA pins are available for user applications. FPGA pins are connected to switch SW3, a SPST slide-actuated DIP switch. The switches are connected to logic level 0 when moved to the ON position. Switch position 1 is indicated with an arrow. *Inputs 1-4 are within a 1.5 V bank and inputs 5-8 are within a 2.5 V bank.* The user must program inputs 1-4 to be the LVCMS15 type and inputs 5-8 to be the LVCMS25 type in the design. Figure 12 shows the switches. Note the silk marking associated with SW3-7 is incorrect in revision B, SW3-7 is mapped to K19, per Table 7.

**Figure 11. ECP5-5G Versa Development Board LEDs and Switches**

The designated pins are connected according to Table 7.

**Table 7. FPGA Ball to DIP Switch Position**

FPGA Ball Number	SW3 DIP Switch Position
H2	1
K3	2
G3	3
F2	4
J18	5
K18	6
K19	7
K20	8

## General Purpose LEDs

(See Appendix A, Sheet 8, Figure 20 - LEDs and Switches)

The LEDs provided on the ECP5-5G Versa Development Board are connected to general purpose FPGA I/Os. These LEDs provide status for user designs and must be included in the design. The LEDs illuminate when the FPGA output is driven LOW. Table 8 shows the LED and associated FPGA pins. These pins are within an I/O bank connected to 2.5 V and the user should program these to be LVCMOS25 type outputs in the design.

**Table 8. LED Definitions**

LED Designator	FPGA Ball Number	LED Color
D25	E16	Yellow
D24	D17	Yellow
D22	D18	Green
D21	E18	Green
D26	F17	Red
D27	F18	Red
D28	E17	Red
D29	F16	Red

## Alpha-numeric LED Display

(See Appendix A, Sheet 8, Figure 20 - LEDs and Switches)

A 14-segment alpha-numeric display is provided on the board (D23). These LED segments are connected to general-purpose FPGA I/Os. The LEDs must be included in the FPGA design. The LEDs illuminate when the FPGA output is driven LOW. Table 9 shows the LED and associated FPGA pins. These pins are within an I/O bank connected to 2.5 V and the user should program these to be LVCMOS25 outputs in the design.

**Figure 12. 14-Segment Display**

**Table 9. Alpha-numeric LED Definitions**

Display	FPGA Ball Number	Display	FPGA Ball Number
A	M20	J	N18
B	L18	K	P17

E	L17	N	R16
F	M18	P	R17
G	N16	DP	U1
H	M17		

## DDR3 Memory Device

(See Appendix A, Sheet 7, Figure 19 - DDR3 Memory)

- The ECP5-5G Versa Development Board is equipped with an SDRAM memory device (1.5 V, 64 Mb/x16, 96-ball FBGA, 933 MHz, DDR3-1866) such as the Micron MT41K64M16TW-107:J device.
- The DDR3 memory includes a 16-bit wide memory controller interface.
- The board includes termination of data, address and command signals. It includes all power and external components needed to demonstrate the memory controller of the ECP5-5G device.
- A 100 MHz on-board clock oscillator is available to provide a DDR3 reference clock.

## Ethernet Interfaces

(See Appendix A, sheets 5 and 6 "10/100/1000-T PHY#x/RJ45")

Two Marvell 88E1512 Gigabit Ethernet transceiver devices (U14 and U15) are included on the board. These physical layer devices support 1000BASE-T, 100BASE-TX, and 10BASE-T applications via a standard media interface to a dual RJ45 connection. The RJ45 connection includes network magnetics providing the proper signal conditioning, electro-magnetic interference suppression and signal isolation. Each connector includes two LEDs which are controlled by the 88E1512 devices. Detailed descriptions are available in the Marvell device data sheet.

**Table 11. PHY Status Indicators**

LED	Status Description
RJ45 (Yellow)	Data RX/TX
RJ45 (Green/Orange)	Link State

Each Marvell 88E1512 device communicates via a RGMII interface to the ECP5-5G device.
