

# Digital Systems and Microprocessor Design (H7068)

---

## 10. Exercises / Laboratory

---

Daniel Roggen  
d.roggen@sussex.ac.uk

## Objective / success criteria

- Prerequisite: lab of week 8
- The objective of this laboratory is to:
  - Understand the memory addressing mode of the educational processor
- Success criteria:
  - You are able to understand and predict the action of the move memory instructions

# Tutorial I

- You are going to try simple programs using the mov r,[src] instruction to understand its behavior
- Both immediate and register sources will be tested

| Instructions | instruction(15..8) |   |   |             |      |      | Instruction(7..0) |   |     |   |   |   |   |   |   |   |
|--------------|--------------------|---|---|-------------|------|------|-------------------|---|-----|---|---|---|---|---|---|---|
|              | Opcode             |   |   | $\bar{R}/I$ | dd#m | sd#m | dreg              |   | src |   |   |   |   |   |   |   |
| mov r, r     | 0                  | 0 | 0 | 0           | 0    | 0    | r                 | r | -   | - | - | - | - | - | r | r |
| mov r, i     | 0                  | 0 | 0 | 1           | 0    | 0    | r                 | r | i   | i | i | i | i | i | i | i |
| mov r, [r]   | 0                  | 0 | 0 | 0           | 0    | 1    | r                 | r | -   | - | - | - | - | - | r | r |
| mov r, [i]   | 0                  | 0 | 0 | 1           | 0    | 1    | r                 | r | i   | i | i | i | i | i | i | i |
| mov [r], r   | 0                  | 0 | 0 | 0           | 1    | 0    | r                 | r | -   | - | - | - | - | - | r | r |
| mov [r], i   | 0                  | 0 | 0 | 1           | 1    | 0    | r                 | r | i   | i | i | i | i | i | i | i |

# Tutorial I

- Consider the following program:

```
00    mov    ra,[1d]    141D
02    mov    rb,[1e]    151E
04    mov    rc,1f      121F
06    mov    rd,[rc]    0702
```

- In addition, fill in the memory with the following values at these locations:

| Addr | Data |
|------|------|
| 1D   | 33   |
| 1E   | 44   |
| 1F   | 55   |

# Tutorial I

- Answer the following questions running the instructions in your head and verifying on the board:
- What is the resulting content of registers RA, RB, RC, RD?
- Explain in your words what the `mov dst,[src]` instruction does
- How is the behaviour different than this program:

```
00    mov    ra,1d    101D
02    mov    rb,1e    111E
04    mov    rc,1f    121F
06    mov    rd,rc    0302
```

# Tutorial I

- Remember the 3 clock cycles per instruction: fetch high, fetch low, and execute. The board shows the address placed on the memory bus during each cycle (mem addr)

- Explain what is placed on mem\_addr at each clock cycle and why?
- How is what is on mem\_addr different during the execute cycle when the instruction is a move memory (e.g. at address 0, 2 and 6 of the first program) v.s. when the instruction is not a mov memory (at address 4 of the first program)

# Tutorial II

- You are going to try simple programs using the mov [r],src instruction to understand its behavior
- Both immediate and register sources will be tested

| Instructions | instruction(15..8) |   |   |             |      |      | Instruction(7..0) |   |     |   |   |   |   |   |   |   |
|--------------|--------------------|---|---|-------------|------|------|-------------------|---|-----|---|---|---|---|---|---|---|
|              | Opcode             |   |   | $\bar{R}/I$ | dd#m | sd#m | dreg              |   | src |   |   |   |   |   |   |   |
| mov r, r     | 0                  | 0 | 0 | 0           | 0    | 0    | r                 | r | -   | - | - | - | - | - | r | r |
| mov r, i     | 0                  | 0 | 0 | 1           | 0    | 0    | r                 | r | i   | i | i | i | i | i | i | i |
| mov r, [r]   | 0                  | 0 | 0 | 0           | 0    | 1    | r                 | r | -   | - | - | - | - | - | r | r |
| mov r, [i]   | 0                  | 0 | 0 | 1           | 0    | 1    | r                 | r | i   | i | i | i | i | i | i | i |
| mov [r], r   | 0                  | 0 | 0 | 0           | 1    | 0    | r                 | r | -   | - | - | - | - | - | r | r |
| mov [r], i   | 0                  | 0 | 0 | 1           | 1    | 0    | r                 | r | i   | i | i | i | i | i | i | i |

## Tutorial II

- Consider the following program:

```
00    mov    ra,1e    101E
02    mov    rb,99    1199
04    mov    [ra],rb  0801
06    add   ra,01    3001
08    mov    [ra],88  1888
```

- In addition, fill in the memory with the following values at these locations:

| Addr | Data |
|------|------|
| 1E   | 44   |
| 1F   | 55   |

# Tutorial II

- Answer the following questions running the instructions in your head and verifying on the board:
- What is the content of memory locations 1E and 1F after executing the program?
- Explain in your words what the `mov dst,[src]` instruction does
- How is the behaviour different than this program:

```
00    mov    ra,1e    101E
02    mov    rb,99    1199
04    mov    ra,rb    0001
06    add    ra,01    3001
08    mov    ra,88    1088
```

# Tutorial II

- In tutorial I and II we used some memory locations to store **data**. Discuss what makes the difference (if any) between a memory location corresponding to an instruction or to data.
- How does the processor know if a memory location is instruction or data?
- Explain why are there no mov instructions to do at the same time a read from memory and a write to memory (e.g. `mov [a],[1Eh]`)?
- Discuss what modifications to the processor would be required to have such a mov instruction reading and writing to memory at the same time

## Tutorial III

- Consider the following program

```
00    mov    ra,07        1007
02    mov    rb,00        1100
04    mov    [ra],rb      0801
06    out    00           D000
08    add    rb,1         3101
0A    jmp    04           B004
```

## Tutorial III

- What do you expect the out instruction to do on the LEDs?
- Execute the program for ~50 clock cycles: what happens on the LEDs?
- Can you explain the result?

## Tutorial III

- Go into the memory edit mode, and check the content of memory locations 4-8; does it correspond to the program you entered?
- With this knowledge, to what kind of program are you dealing with?
- What could be the uses for such kind of programs?

# Coursework assignment

- Take time to advance the coursework assignment!
- If you want to create a custom program discuss with me if the complexity is adequate to get a full mark.
