Description:

The signed half-word elements of general-purpose register rA are multiplied by the signed half-word elements of general-purpose register rB to form intermediate results. They are then added to the signed half-word VMAC elements to form the final results that are placed again in the VMAC registers. The intermediate result is placed into general-purpose register rD. If any of the final results exceeds the min/max value, it is saturated.

Description:

The lower half of the 4-bit elements in general-purpose register rA are sign-extended and placed into general-purpose register rD.

32-bit Implementation:

```
N/A
```

64-bit Implementation:

```
rD[7:0] <- exts(rA[3:0])
rD[15:8] <- exts(rA[7:4])

Format:

```
lv.xor rD,rA,rB
```

Description:

The contents of general-purpose register rA are combined with the contents of general-purpose register rB in a bit-wise logical XOR operation. The result is placed into general-purpose register rD.

32-bit Implementation:

```
N/A
