Overview

A UART component (Universal Asynchronous Transmitter / Receiver) is used for the asynchronous transmission and reception of data. Asynchronous referring to the lack of a clock signal during transmission or reception.

uart6551 is a WDC6551 register compatible uart. The uart is a 32-bit peripheral device supporting a 256-byte configuration space.

Baud rate is controlled by clock divider which assumes a 200MHz baud reference clock input. If a different clock frequency is used, then the divider table will need to be updated. The baud rate may also be controlled via a clock divider register. This register is 24 bits so gives a minimum frequency of 11.92 Hz assuming a 200MHz clock. ($200\text{MHz} / 2^{24}$).

Special Features

- WDC6551 register compatibility.
- 256-byte configuration space

Config Space

A 256-byte config space is supported. Most of the config space is unused. The only configuration is for the I/O address of the register set.

Regno	Width	R/W	Moniker	Description
000	32	RO	REG_ID	Vendor and device ID
004	32	R/W		
008	32	RO		
00C	32	R/W		
010	32	R/W	REG_BAR0	Base Address Register
014	32	R/W	REG_BAR1	Base Address Register
018	32	R/W	REG_BAR2	Base Address Register
01C	32	R/W	REG_BAR3	Base Address Register
020	32	R/W	REG_BAR4	Base Address Register
024	32	R/W	REG_BAR5	Base Address Register
028	32	R/W		
02C	32	RO		Subsystem ID
030	32	R/W		Expansion ROM address
034	32	RO		
038	32	R/W		Reserved
03C	32	R/W		Interrupt
040 to 0FF	32	R/W		Capabilities area

REG_BAR0 defaults to \$FE000001 which is used to specify the address of the controller's registers in the I/O address space. A 16B region is reserved.

The controller will respond with a memory size request of 0MB (0x0) when BAR0, BAR1, or BAR2 is written with all ones. The controller does not use any memory and does not require memory allocated from the system.

Parameters

CFG_BUS defaults to zero
 CFG_DEVICE defaults to sixteen
 CFG_FUNC defaults to zero
 CFG_IRQ_LINE defaults to sixteen
 Config parameters must be set correctly. CFG device and vendors default to zero.

Interrupts

The is a 32-bit output bus for interrupts. Which bit of the bus is the active bit for interrupts is determined from the Int Line setting in the config space. The remaining bits of the bus will always be zero, allowing the bus to be wire or'd with other interrupt output busses.

Interrupts may be globally enabled or disabled by the interrupt disable bit in the config space.

Register Description

There are only four registers in the design. The function of the low order eight bits of the registers matches the 6551 function. The controller honors byte lane selects so only the portion of the register selected is written.

Reg	Moniker	Description
0	UART_TRB	Transmit and receive buffer. Data written is transmitted, on a read data available is read. Also reads / writes the clock multiplier if access to clock multiplier is enabled.
1	UART_STAT	Status Register. Returns status bits on a read, a write of any value will cause a reset of some of the command register bits
2	UART_CMD	Command register
3	UART_CTRL	Control register

UART_TRB

This register is 32-bits wide of which only the lower eight bits are used to transmit or receive data by the uart. Data written to the register is transmitted. A register read returns data received by the uart. When the fifo's are enabled writing to this register writes to the transmit fifo. Reading this register reads the receive fifo. If clock divider access is enabled (via control register bit 31) then this register allows modifying or reading the clock divider value. Writing a clock divider value to this register automatically switches the function back to transmit / receive.

UART_STAT

Uart status register. Writing any value to the status register resets some of the uart's command bits.

Bit	Status	
0	Parity Error	1 = parity error occurred, 0 = no error
1	Framing Error	1 = framing error
2	Overrun	1 = overrun
3	Rx Full	1 = receiver data available
4	Tx Empty	1 = open slot in transmit fifo
5	DCD	0 = data carrier present
6	DSR	0 = data set ready
7	IRQ	1 = irq occurred
Additional Line Status Byte		

8	reserved	
9	reserved	
10	reserved	
11	reserved	
12	Break received	1 if a break signal is received
13	Tx Full	1 = transmit fifo full
14	reserved	
15	G Rcv Err	1 = global receiver error (set if any error status is set)
Additional Modem Status Byte		
16	CTS	1 = CTS line changed state
17	DSR	1 = DSR line changed state
18	RI	1 = RI line changed state
19	DCD	1 = DCD line changed state
20	CTS	CTS state
21	reserved	
22	RI	RI state
23	reserved	
IRQ Status		
24,25	zero	these two bits are zero
26 to 28	IRQENC	encoded irq value (0 to 7)
29 to 30	reserved	
31	irq	IRQ is set

UART_CMD

Bit		
0	DTR	output 1 = low, 0 = high
1	RxIe	receiver interrupt enable 0 = enabled, 1 = disabled
2,3	RTS Control	
	00	output RTS high
	01	output RTS low, enable transmit interrupt
	10	output RTS low,
	11	output RTS low, send a break signal
4	LLB	1 = local loopback (receiver echo)
5 to 7	Parity Control	
	000	no parity
	001	odd parity
	011	even parity
	101	transmit mark parity (parity error disabled)
	111	transmit space parity (parity error disabled)
8	LSIe	line status change interrupt enable 1 = enabled
9	MSIe	modem status change interrupt enable 1 = enabled
10	RxToIe	receiver timeout interrupt enable 1 = enabled
11 to 31	reserved	

UART_CTRL

Bit		
0 to 3	Baud Rate	
	0000	Use 16x external clock
	0001	50
	0010	75
	0011	109.92
	This table is expanded using an extra control bit #27.	

	0100	134.58	
	0101	150	
	0110	300	
	0111	600	
	1000	1200	
	1001	1800	
	1010	2400	
	1011	3600	
	1100	4800	
	1101	7200	
	1110	9600	
	1111	19200	
4	Rx clock source		1 = external, 0 = baud rate generator
5,6	Word length		code for word length in bits
	00	8	
	01	7	
	10	6	
	11	5	
7	Stop Bit		
	0	1	
	1	1 if 8 bits and parity	
	1	1.5 if 5 bits and no parity	
	1	2 otherwise	
8 to 15	reserved		do not use
16	Fifo enable		1 = fifo's enabled
17	Rx Fifo Clear		1 = clear receiver fifo
18	Tx Fifo Clear		1 = clear transmit fifo
19	reserved		
20,21	Transmit Threshold		Threshold for DMA signal activation If the transit fifo count is less than the threshold then a DMA transfer is triggered.
	0	1 byte	
	1	¼ full	
	2	½ full	
	3	¾ full	
22, 23	Receive Threshold		Threshold for DMA signal activation. If the receive fifo count is greater than the threshold then a DMA transfer is triggered.
	0	1 byte	
	1	¼ full	
	2	½ full	
	3	¾ full	
24	hwfc		1 = automatic hardware flow control
25	reserved		
26	dmaEnable		1 = dma enabled
27	Baud Rate bit 4		Extended baud rate selection bit, used in combination with bits 0 to 3.
	10000	38400	
	10001	57600	
	10010	115200	
	10011	230600	
	10100	460800	
	10101	921600	
	10110	reserved	
	10111	reserved	

	11xxx	reserved	
28,29	reserved		
30	selDV		1 = use clock divider register, 0 = use baud table
31	accessDV		1 = access clock divider via TRB register, 0 = normal TRB operation

Selecting the clock divider register as the baud source allows any programmable baud rate.

Ports

Signal	I/O	Wid	Purpose
rst_i	I	1	reset
clk_i	I	1	bus clock input
cs_config_i	I	1	circuit/core select for config space
cs_io_i	I	1	circuit/core select for IO space
irq_o	O	32	interrupt request bus output (only configured output may be active)
WISHBONE SIGNALS			
cyc_i	I	1	bus cycle valid
stb_i	I	1	data transfer strobe
ack_o	O	1	data transfer acknowledge
we_i	I	1	write enable
sel_i	I	4	byte lane selects (ground select bits 1 to 3 if using as an 8-bit peripheral)
adr_i	I	2	address bits 2,3 (selects register)
dat_i	I	32	data input bus (ground bits 8 to 31 if using as an 8-bit peripheral)
dat_o	O	32	data output bus
Modem Controls			
cts_ni	I	1	clear to send input active low.
rts_no	O	1	request to send output active low
dsr_ni	I	1	data set ready active low
dcd_ni	I	1	data carrier detect active low
dtr_no	O	1	data terminal ready active low
ri_ni	I	1	ring indicator active low
rxd_i	I	1	serial data input (receive)
txd_o	O	1	serial data output (transmit)
data_present	O	1	data is present in the receiver
rxDRQ_o	O	1	receiver DMA request
txDRQ_o	O	1	transmitter DMA request
xclk_i	I	1	external baud rate clock
RxC_i	I	1	external receiver clock
